This module (`isis-module-servletapi`) provides access to various elements of the Servlet API, namely the `ServletContext`, the `HttpServletRequest` and the `HttpServletResponse`.

For each of these APIs a corresponding "provider" domain service exists; for example `ServletContextProvider` service provides access to the `ServletContext`.

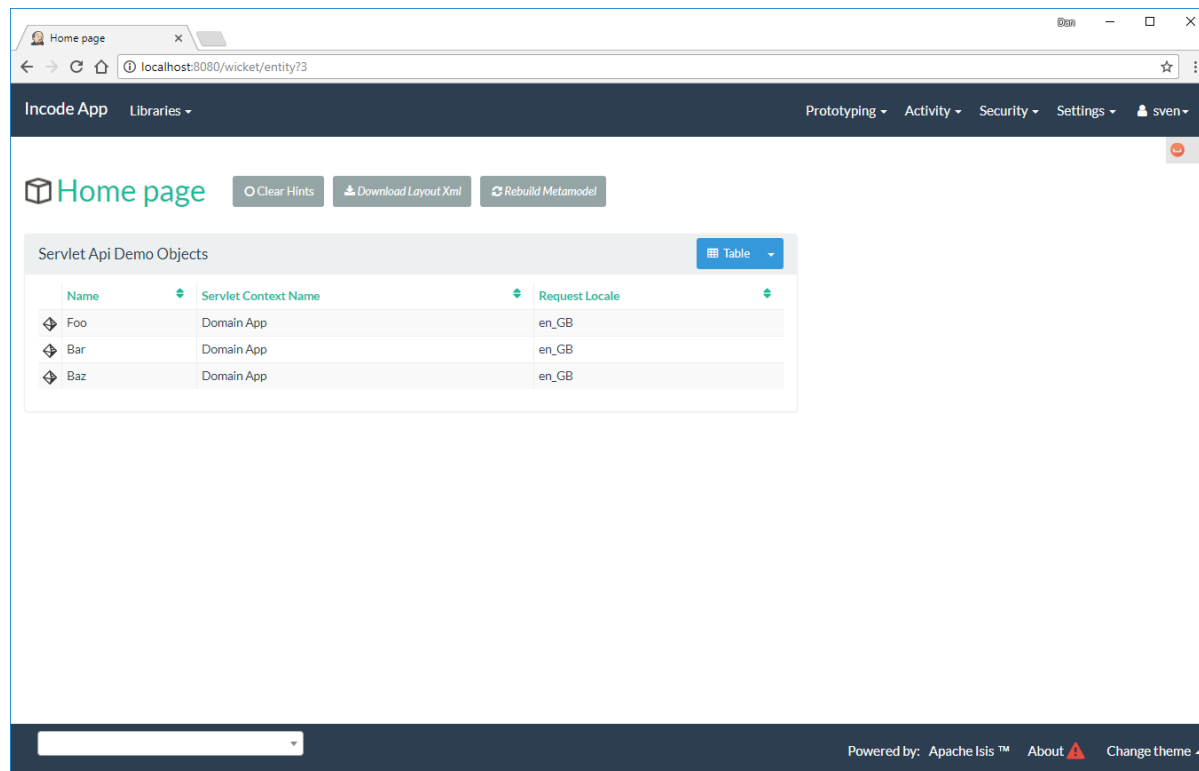

This module is only available for Wicket viewer, not the REST API.

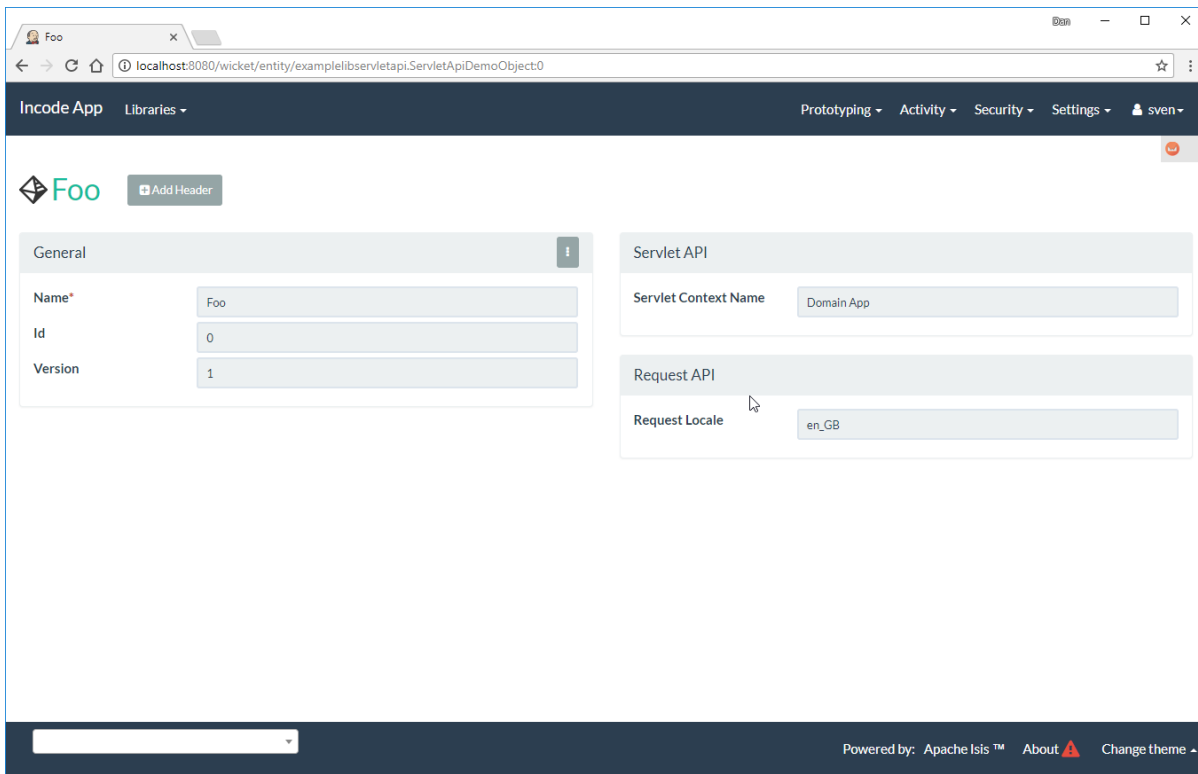

# Screenshots

The module's functionality can be explored by running the [quickstart with example usage](#) using the `org.incode.domainapp.example.app.modules.ExampleDomLibServletApiAppManifest`.

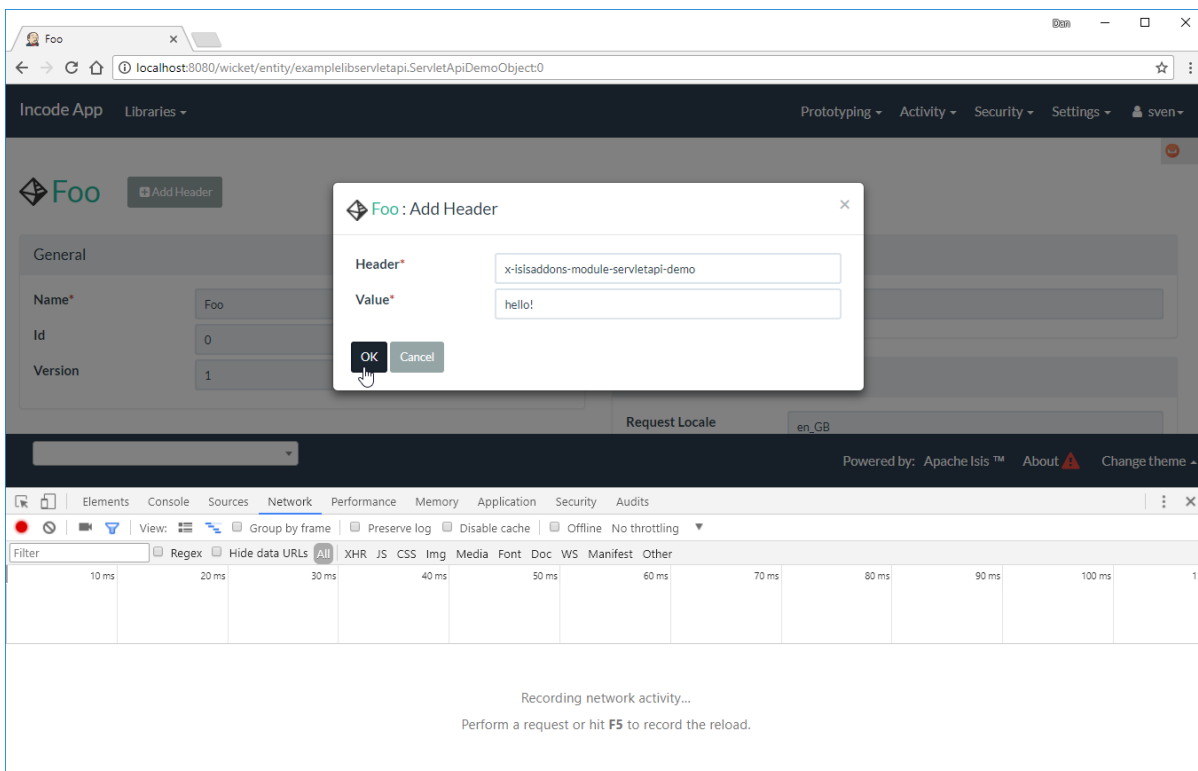

A home page is displayed when the app is run:

The demo object has all of the various "provider" domain services injected into it. It uses the `ServletContextProvider` and the `HttpServletRequestProvider` services to simply show the servlet context name and user's locale:

To demonstrate the use of the `HttpServletResponseProvider`, the demo object provides an "addHeader" action:

When invoked, this adds a HTTP header to the response:

# How to configure/use

## Classpath

Update your classpath by adding this dependency in your **dom** project's **pom.xml**:

```
<dependency>
  <groupId>org.isisaddons.module.servletapi</groupId>
  <artifactId>isis-module-servletapi-dom</artifactId>
  <version>1.15.0</version>
</dependency>
```

Check for later releases by searching [Maven Central Repo](#).

For instructions on how to use the latest **-SNAPSHOT**, see the [contributors guide](#).

## Bootstrapping

In the **AppManifest**, update its **getModules()** method, eg:

```
@Override
public List<Class<?>> getModules() {
    return Arrays.asList(
        ...
        org.isisaddons.module.servletapi.ServletApiModule.class,
        ...
    );
}
```

# API & Implementation

The `ServletContextProvider` defines the following API:

```
public class ServletContextProvider {  
    public ServletContext getServletContext() { ... }  
}
```

The `HttpServletRequestProvider` defines the following API:

```
public class HttpServletRequestProvider {  
    public HttpServletRequest getHttpServletRequest() { ... }  
}
```

And finally the `HttpServletResponseProvider` defines the following API:

```
public class HttpServletResponseProvider {  
    public HttpServletResponse getHttpServletResponse() { ... }  
}
```

These actions are all programmatic and do not appear in the UI.

# Known issues

None known at this time.

# Dependencies

Maven can report modules dependencies using:

```
mvn dependency:list -o -pl modules/lib/servletapi/impl -D excludeTransitive=true
```

which, excluding Apache Isis itself, returns these compile/runtime dependencies:

```
org.apache.geronimo.specs:geronimo-servlet_3.0_spec:jar:1.0  
org.apache.wicket:wicket-core:jar:7.8.0
```

The direct Wicket dependency is because the module implementation depends on Apache Isis, and in particular on Apache Isis' Wicket viewer. This means that it cannot be used within domain objects invoked from the REST API (Restful Objects viewer).

For further details on 3rd-party dependencies, see:

- [Apache Wicket](#)
