Country Subdomain

Table of Contents

This module (`incode-module-country`) provides a `Country` and a `State` entity, for use as reference data.

Example App

The module's functionality can be explored by running the quickstart with example usage using the `org.incode.domainapp.example.app.modules.ExampleDomDomCountryAppManifest`.

How to configure/use

Classpath

Update your classpath by adding this dependency in your dom project's `pom.xml`:

```xml
<dependency>
    <groupId>org.incode.module.country</groupId>
    <artifactId>incode-module-country-dom</artifactId>
    <version>1.14.0</version>
</dependency>
```

Check for later releases by searching Maven Central Repo.

For instructions on how to use the latest `-SNAPSHOT`, see the contributors guide.

Bootstrapping

In the `AppManifest`, update its `getModules()` method, eg:

```java
@Override
public List<Class<?>> getModules() {
    return Arrays.asList(
            ...
            org.incode.module.country.dom.CountryModule.class,
    );
}
```

Known issues

None known at this time.

Dependencies

Maven can report modules dependencies using:

```
mvn dependency:list -o -pl modules/dom/country/impl -D excludeTransitive=true
```

which, excluding the Incode Platform and Apache Isis modules, returns no direct compile/runtime dependencies.

From the Incode Platform it uses:

- base library module

The module also uses icons from icons8.
